Docket No.: 10021.002510 (P0309)

Amendment and Response To Office Action

December 5, 2005 -

## **AMENDMENTS TO THE CLAIMS**

Please amend the above-identified application as follows:

Claims 1-3 (canceled)

Claim 4 (original): A movable membrane for light modulation, comprising:

a substantially circular optically active portion; and

a released membrane portion surrounding the circular optically active portion, wherein:

the substantially circular optically active portion includes a plurality of gaps configured to expose a lower surface.

- Claim 5 (original): The movable membrane for light modulation of claim 4, wherein: the substantially circular optically active portion remains substantially flat while deflected.
- Claim 6 (original): The movable membrane for light modulation of claim 5, wherein:

  an area of the lower surface exposed through the plurality of gaps is
  substantially equal to an upper surface area.
- Claim 7 (original): The movable membrane for light modulation of claim 5, wherein:

  an optical energy of the lower surface exposed through the plurality of
  gaps is substantially equal to an upper surface optical energy.

Claim 8 (currently amended): A micro electromechanical system (MEMS) device capable of light modulation, the device comprising:

a membrane configured to be controllably deflected;

Docket No.: 10021.002510 (P0309)

Amendment and Response'To Office Action

December 5, 2005 -

a support structure configured to support the membrane;

[[an]] <u>a substantially circular</u> optically-active portion of the membrane that is reflective and configured to be illuminated;

a non-optically-active portion of the membrane between the optically-active portion and the support structure; and

a plurality of gaps in the optically-active portion of the membrane.

Claim 9 (original): The device of claim 8, further comprising:

a substrate below the membrane having reflective areas under the plurality of gaps.

Claim 10 (original): The device of claim 9, wherein the non-optically-active membrane portion is substantially larger in area than the optically-active membrane portion.

Claim 11 (original): The device of claim 10, wherein the optically-active membrane portion bends less than the non-optically-active membrane portion when the membrane is controllably deflected.

Claim 12 (original): The device of claim 11, wherein the optically-active membrane portion remains substantially flat when the membrane is controllably deflected.

Claim 13 (original): The device of claim 9, wherein the gaps in the optically-active membrane portion are configured so that substantially equal optical energies are reflected from the membrane and from the substrate below the membrane.

Claim 14 (original): The device of claim 13, wherein both the optically-active membrane portion and the reflective areas under the gaps are covered with a same reflective material.

Claim 15 (original): The device of claim 14, wherein the reflective material comprises aluminum.

Docket No.: 10021.002510 (P0309)

Amendment and Response To Office Action

December 5, 2005.

Claim 16 (original): The device of claim 8, wherein the membrane comprises a compliant material from a group of compliant materials including polymeric materials, metals, polycrystalline materials, and amorphous materials.

Claim 17-20 (cancelled)
